

What is a microgrid performance assessment framework?

A microgrid multi-dimensional performance assessment framework is proposed. The framework can quantify and analyze the correlation among 3 key indicators. A comprehensive performance is quantified under different energy portfolios. Economics, reliability and renewable energy penetration are assessed together.

How can we assess the performance of a microgrid?

This framework can effectively assess the multi-dimensional performance of the microgrid considering three key performance indicators, including economics, renewable energy penetration and reliability. The proposed framework is tested and verified on an islanded microgrid located on an island in the subtropical region.

Is a power quality assessment method suitable for microgrid systems?

The proposed method is suitable for both single-node and multi-node power quality assessment scenarios in microgrid systems. Compared with the traditional power quality evaluation method, the method proposed in this paper reflects the actual power quality problems of the microgrid more objectively and accurately.

What are the key indicators of a microgrid?

Reliability Reliability (Re) is another key indicator. It is used to assess the power balance of the microgrid. It refers to "the ability to meet the electricity needs of end-use customers, even when unexpected equipment failures or other conditions reduce the amount of available power supply" [35 ].

How is microgrid multi-dimensional performance assessment quantified?

Microgrid multi-dimensional performance assessment quantification. At this step, the parameters of the empirical cost model are identified according to the obtained key indicators. Then, the quantitative assessment results can be obtained using the empirical model. Fig. 1.

Why do microgrid systems need a preliminary assessment?

However, for those large-scale or/and complex microgrid systems, the assessments of the system performance at the planning stage are conducted first due to the high computation cost. The preliminary assessment results provide guidelines for further system optimal design.
