

Photovoltaic inverter IGBT comparison MOSFET

What is the difference between Si MOSFET and IGBT?

Si MOSFET and IGBT are driven by 12 V gate-source voltage whereas SiC MOSFET is operated by 18 V gate-source voltage using the gate driver circuit. An experimental study is performed for the comparative efficiency analysis for Si, SiC MOSFETs and IGBT device based converter for 20 and 50 kHz switching frequencies.

What is the difference between a SiC MOSFET based inverter and IGBT based?

Prioritizing high efficiency over size by decreasing switching frequency whilst increasing the size of the inductor works well with both inverters, with the SiC MOSFET based inverter only achieving a slightly higher efficiency of 97.7 % compared with 97.0 % of the Si IGBT based inverter.

How is a single-phase inverter based on IGBT and MOSFET simulated?

A single-phase inverter based on IGBT and MOSFET is designed and simulated in a MATLAB-Simulink environment. The voltage drop and thereby the power loss across the switches are compared by simulation. The inverter switching is carried out by Pulse Width Modulation (PWM) technique, which has many advantages than other techniques.

What is an integrated MOSFET (IGBT)?

In practice, integrated modules of multiple MOSFETs or IGBTs are typically used at the higher power levels. Central inverters in utility-scale applications generate three-phase AC output at megawatt levels with the highest PV panel voltages and multilevel or paralleled inverters using typically IGBT modules.

What is a silicon carbide insulated gate bipolar transistor (IGBT)?

Compared to the traditional silicon (Si) insulated gate bipolar transistor (IGBT) power device, the silicon carbide (SiC) metal-oxide-semiconductor field-effect transistor (MOSFET) has shown apparent advantages in high-power density inverters with a high switching frequency.

Which MOSFET based converter has highest efficiency?

An experimental study is performed for the comparative efficiency analysis for Si, SiC MOSFETs and IGBT device based converter for 20 and 50 kHz switching frequencies. It is found that SiC based converter provides highest efficiency ? 97.8%, whereas the lowest efficiency ? 94% is found for IGBT based converter at 20 kHz switching frequency.

It is useful to consider the differences between a practical PV boost converter based on a PIM-IGBT vs one using a PIM-SiC device. A nearby table summarizes the two with an input of 500 V, 25 A and an output of 800 ...
