What is compressed carbon dioxide energy storage (CCES)?

They are now characterized as large-scale, long-lifetime and cost-effective energy storage systems. Compressed Carbon Dioxide Energy Storage (CCES) systems are based on the same technology but operate with CO<sub>2</sub> as working fluid. They allow liquid storage under non-extreme temperature conditions.

Is compressed carbon dioxide energy storage technology a promising prospect?

Compressed carbon dioxide energy storage technology shows a promising prospect due to unique advantages. Considering the remarkable effect of working medium storage mode on the system performance, four compressed carbon dioxide energy systems based on different carbon dioxide storage modes are proposed in this paper.

Can carbon dioxide be used in a low-pressure compressed gas energy storage system?

In experimental research on the CCES system, Alirahmi et al.<sup>73</sup> explored the use of carbon dioxide as the working fluid in a low-pressure compressed gas energy storage system. They gathered experimental data on key thermal parameters of the CCES system by constructing a test-bed.

Why is compressed carbon dioxide energy storage important?

It could reduce the volatility of renewable energy generation, assist the stable operation of power grid and enhance the comfort of users. Compressed carbon dioxide energy storage technology shows a promising prospect due to unique advantages.

How does a carbon dioxide energy storage system work?

Zhang et al.<sup>47</sup> proposed a carbon dioxide energy storage system that combines underground strata of different depths, as illustrated in Fig. 7. The system maintains the temperature of carbon dioxide relatively constant based on the temperature characteristics of rock strata at various depths.

Is carbon dioxide a good energy storage system?

In conclusion, as compared to air, carbon dioxide has several distinct benefits as an energy storage system. Pumps, rather than compressors, may be applied to enhance storage pressure since it has a higher dew point temperature and is easier to condense than air.
