What is a semiconductor in physics?

Those materials in which at room temperature (or at the temperature of use) a small but observable number of electrons, corresponding to the F-D distribution, have a high enough energy to escape from the valence band into the conduction band are called semiconductors.

What is the difference between direct and indirect band gap semiconductors?

In a direct band gap semiconductor, the top of the valence band and the bottom of the conduction band occur at the same value of momentum, as in the schematic below. In an indirect band gap semiconductor, the maximum energy of the valence band occurs at a different value of momentum to the minimum in the conduction band energy:

What is the energy gap of a semiconductor?

The energy gap of a semiconductor is small, in the range 0.5eV to 3eV . In the presence of a small applied voltage, electric field, or optical field, a semiconductor acts as an insulator. In the presence of a large applied voltage or other energy source, a semiconductor acts as a conductor, and electrons flow.

What is the difference between semiconductors and insulators?

The distinction between semiconductors and insulators arises because in small band gap materials at room temperature a small, but appreciable, number of electrons can be excited from the filled valence bands into the unfilled conduction bands simply by thermal vibration.

Which valence band occupy the lowest possible states in a semiconductor?

In a pure semiconductor at $T = 0\text{ K}$, all electrons occupy the lowest possible states. The valence band is completely filled, and the conduction band is completely empty. The Fermi level, E_f , is the energy level at the middle of the energy gap.

What is the energy gap between valence band and conduction band?

The energy gap between valence band and conduction band in an insulator is typically above 3 eV . A little heat or energy from vibrations is not enough to excite an electron from one allowed energy state to another. If a large enough external source of energy is applied, though, an electron can be excited or ripped off of an insulator.
