

How is solar energy generated?

Solar energy - Electricity Generation: Solar radiation may be converted directly into solar power (electricity) by solar cells, or photovoltaic cells. In such cells, a small electric voltage is generated when light strikes the junction between a metal and a semiconductor (such as silicon) or the junction between two different semiconductors.

How does solar power work?

Solar power works by converting energy from the sun into power. There are two forms of energy generated from the sun for our use - electricity and heat. Both are generated through the use of solar panels, which range in size from residential rooftops to 'solar farms' stretching over acres of rural land. Is solar power a clean energy source?

What is solar power?

The Editors of Encyclopaedia Britannica This article was most recently revised and updated by Melissa Petruzzello. Solar power is a form of energy conversion in which sunlight is used to generate electricity.

How is solar energy used?

Solar power is used in two main ways: generating electricity (like with rooftop solar panels) or generating thermal energy (like with concentrated solar power plants). For most homeowners, solar panels that convert solar energy to electricity are the best use of solar energy because it allows them to save on electric bills.

Can solar panels generate electricity?

Yes, it can - solar power only requires some level of daylight in order to harness the sun's energy. That said, the rate at which solar panels generate electricity does vary depending on the amount of direct sunlight and the quality, size, number and location of panels in use.

Where does solar power come from?

Any point where sunlight hits the surface of the earth is a potential location to generate solar power. Renewable energy technologies generate electricity from infinite resources and since solar energy comes from the sun, it represents a limitless source of power.
