

How does solar power work?

Solar power works by converting energy from the sun into power. There are two forms of energy generated from the sun for our use - electricity and heat. Both are generated through the use of solar panels, which range in size from residential rooftops to 'solar farms' stretching over acres of rural land. Is solar power a clean energy source?

How do solar panels generate electricity?

This process is constant: Over 500 million tons of hydrogen atoms are converted into helium every second, resulting in photons that generate solar energy here on Earth. In a nutshell, solar panels generate electricity when photons (those particles of sunlight we discussed before) strike solar cells. The process is called the photovoltaic effect.

How does solar energy conversion work?

The initial step in the process of solar energy conversion involves the absorption of sunlight by the photovoltaic (PV) cells within a solar panel. These cells, constructed from semiconductor materials such as silicon, capture photons from sunlight. When these photons strike the PV cells, they excite electrons, thereby creating an electric current.

How do solar panels convert solar energy into heat?

Instead, the solar panels, known as 'collectors,' transform solar energy into heat. Sunlight passes through a collector's glass covering, striking a component called an absorber plate, which has a coating designed to capture solar energy and convert it to heat.

Do solar panels generate electricity at night?

Solar panels generate no electricity at night time. Solar panels can't store energy, so you have to use the electricity they generate when the sun is shining. You need batteries to store the energy generated. These are expensive. - Solar cells convert the light from the sun into electricity.

How do solar farms work?

Solar farms are large areas of land that can be covered with thousands of solar panels that generate lots of electricity. Some solar farms have fixed solar panels that always face the same direction. Some have moving panels that turn so that they always directly face the Sun. This helps them generate as much electricity as possible.
