

Are lithium-ion batteries a good choice for EVs and energy storage?

Lithium-ion (Li-ion) batteries are considered the prime candidate for both EVs and energy storage technologies, but the limitations in terms of cost, performance and the constrained lithium supply have also attracted wide attention.

How many kWh can a rechargeable lithium battery produce?

Rechargeable lithium batteries have the potential to reach the 500 Wh kg⁻¹, and less than \$100 kWh⁻¹ goal. In the last several years, good progress has been made in the fabrication of high-energy lithium cells and good cycle life has been achieved using liquid electrolytes.

Can EVs and battery storage meet the TWh challenge?

Accelerated deployment of EVs and battery storage has the potential to meet this TWh challenge. It is critical to develop new mechanisms to manage and control the whole energy infrastructure, including the charging and discharging of EVs.

How much energy does a lithium ion battery use?

Li-ion batteries have a typical deep cycle life of about 3000 times, which translates into an LCC of more than \$0.20 kWh⁻¹, much higher than the renewable electricity cost (Fig. 4 a). The DOE target for energy storage is less than \$0.05 kWh⁻¹, 3-5 times lower than today's state-of-the-art technology.

How can we reduce the cost of lithium batteries?

It is also critical to further reduce the cost and increase the cycle life of the batteries to meet the cost target for both transportation and grid applications. Many new approaches are being investigated currently, including developing next generation high-energy and low-cost lithium metal batteries.

How much electricity does a 100 kWh EV battery pack use?

For an average household in the US, the electricity consumption is less than 30 kWh. A 100 kWh EV battery pack can easily provide storage capacity for 12 h, which exceeds the capacity of most standalone household energy storage devices on the market already.
