

Do wind turbines have operational control strategies?

This review paper presents a detailed review of the various operational control strategies of WTs, the stall control of WTs and the role of power electronics in wind system which have not been documented in previous reviews of WT control. This research aims to serve as a detailed reference for future studies on the control of wind turbine systems.

Can DFIG wind turbines improve power grid dynamics?

This mainly affects the power system's dynamic performances. Nevertheless, the controllable output power of DFIG wind turbines with appropriate control can be utilized to ameliorate the power grid dynamics.

Can A DFIG wind turbine inject reactive power to a power grid?

It is possible that a DFIG wind turbine can inject the reactive power to a power grid for enhancing the voltage profile during steady and transient states. Several techniques of reactive power and voltage controls of a DFIG wind turbine during the steady state have been presented 72 - 75.

How DFIG wind turbines affect power system performance?

The results and future trend can be summarized as follows. The replacement of synchronous generators by DFIG wind turbines not only reduces the effective system inertia but also aggravates the synchronizing torques. This mainly affects the power system's dynamic performances.

Can A DFIG wind turbine damp a power oscillation?

According to the new Spanish grid code for wind power, a DFIG wind turbine should have the ability of damping power oscillations⁸⁴. By power output modulation control of the DFIG converter, the DFIG wind turbine is capable of damping power oscillations. The oscillation damping methods by a DFIG are clarified in the next part.

How to control wind energy generation?

Thus, it is necessary to develop more advanced control strategies for WECS. To this end, several control methods have been designed and implemented for wind energy generation such as, vector control which is based on voltage and flux oriented vector using the d-q rotating frame to decouple the active and reactive power, [3,4].
